Project 1, Stage 2. Checklist

Project requirements

General

- All the tasks provided in the brief are solved correctly. That means the following:

    - The project doesn't contain extra code, i.e. code that's not required by the brief.

    - Only those parts of the code that are required by the task have been changed.

    - The color settings for all links, section backgrounds, and fonts are implemented according to the brief.

    - Sections have been ordered in accordance with the brief requirements.

    - Images are displayed properly and appear the same as in the brief.

    - Classes defined in the brief are named strictly in accordance with it. All classes are named according to BEM.

    - Absolute positioning is not used unnecessarily. Absolute positioning is only used in instances where static or relative positioning can't be used.

    - Elements with absolute positioning have values specified for both horizontal and vertical positioning properties (e.g. using the `top` and `left` properties). `top` and `bottom` declarations are not used simultaneously, and neither are `left` and `right`.

- There are no typos in the HTML and CSS, and the code is valid. We recommend using the W3C Markup Validator to check your code for validity.

General styles and semantics

- There is a `div` element with the `page` class with specified styles and font from the brief.

- Headings are made using the appropriate tags (from `<h1>` to `<h6>`). Text blocks are made with `<p>` tags. The `<header>`, `<main>`, `<footer>`, `<section>`, `<nav>`, `<ul>`, and `<li>` elements are present in the code and they are used for their intended purposes.

- The sizes of the elements, which are indicated in brief, are set correctly. Values match the brief and the end result is similar to the design. `height` is not used unnecessarily.

Header

- The navigation bar menu is styled using `flexbox`. Styles are set according to the brief. The section matches the design.

- Navigation links work correctly and lead to the corresponding sections. There are `id` attributes assigned to the target sections and `href` attributes with correct values for the link elements.

Section: Events

- There is a `div` element with the `events__cover` class which is placed right after the `events__content` element.

- There is a cafe image.

- There is a `div` wrapper placed right after the cafe image with two classes: `person` and a modifier with the name (e.g. `person_name_feynman`). Inside each of these blocks there are two elements:
  - A paragraph with the `person__caption` class (which contains an inscription)
  - An image with `person__image` and modifier with the size classes (e.g. `person__image_size_l`)

- Photos and paragraphs have been ordered in accordance with the design.

- The person's name modifier classes have `top/right/bottom/left` properties according to the brief.

- All images have an alt attribute with a short description of the picture as its value.
